

# HUNTER EDUCATION COURSEWARE

## SOFTWARE BROCHURE

The Laser Shot Hunter Education software package is an excellent tool for use in hunter training. Proper training using this package will help Hunters improve the following skills and knowledge:

- Hunter Safety and Responsibility
- Safe Use and Handling of Firearms
- Ethical Shooting
- Marksmanship
- Target Acquisition
- Internal structures of game animals
- Inner workings of various firearms

Cost: \$1000 (or included with HE-100 or HE-100P systems). Take a look at what is included:

### Virtual Hunter

Students can train Marksmanship, Target Acquisition, and Ethical Shooting skills with video of live game animals. Choose to hunt such game as Deer, Bear, Elk or Antelope, among others. In each scene, students must quickly decide whether or not to shoot; each shot taken will be scored based on shot location and on the wisdom of taking the shot.

### Anatomy

Using this simulation, shooters can see the inner organs and systems of large game animals. Students can shoot at the animal, then 'peel away' skin, bone and organs to reveal the effectiveness of their shot. An excellent tool to teach hunters optimum shot placement.

### Shot Grouping

Increase marksmanship and shot consistency with this training tool. Students must place a given number of shots within a specified circle diameter in order to succeed. Trainers can set the number of required shots, target distance, and required shot group radius. Results targets can be printed out for record keeping or to give to students.

### Gun Actions

This simulation demonstrates the internal workings of hunting firearms. Students get a clear view of the distinct internal parts of a firearm. Animations show how each part functions in the various stages of firearm actions: trigger pull, fire, spent case discharge and reload. Included actions are Bolt, Lever, Pump, Breach and Semi-Automatic.
